Generative Adversarial Networks, or GANs for short, are an approach to generative modeling using deep learning methods, such as convolutional neural networks. Generative modeling is an unsupervised learning task in machine learning that involves automatically discovering and learning the regularities or patterns in input data in such a way that the model can be used to generate or output new ...

Adversarial search is a search, where we examine the problem which arises when we try to plan ahead of the world and other agents are planning against us. In previous topics, we have studied the search strategies which are only associated with a single agent that aims to find the solution which often expressed in the form of a sequence of actions.

The adversarial system assumes that the best way to get to the truth of a matter is through a competitive process to determine the facts and application of the law accurately. The inquisitorial system is associated with civil law legal systems, and it has existed for many centuries. It is characterized by extensive pre-trial investigation and ...

Generative Adversarial Network Definition. Generative adversarial networks (GANs) are algorithmic architectures that use two neural networks, pitting one against the other (thus the “adversarial”) in order to generate new, synthetic instances of data that can pass for real data.

A team of researchers from Canada and the US has developed a machine learning method to superimpose the catastrophic effects of climate change into real photos using Generative Adversarial Networks (GANs), with the aim of reducing ‘distancing’ – our inability to relate to hypothetical or abstract scenarios regarding climate change. The project, titled ClimateGAN, is [...]

Generative Adversarial Networks vs Variational Autoencoders Both generative adversarial networks and variational autoencoders are deep generative models, which means that they model the distribution of the training data, such as images, sound, or text, instead of trying to model the probability of a label given an input example, which is what a ...

Discriminative vs Generative Models. If you’ve studied neural networks, then most of the applications you’ve come across were likely implemented using discriminative models. Generative adversarial networks, on the other hand, are part of a different class of models known as generative models.. Discriminative models are those used for most supervised classification or regression problems.

Adversarial bandit. Another variant of the multi-armed bandit problem is called the adversarial bandit, first introduced by Auer and Cesa-Bianchi (1998). In this variant, at each iteration, an agent chooses an arm and an adversary simultaneously chooses the payoff structure for each arm.
